PC Intern System Programming

PC Intern is a literal encyclopedia for the PC programmer. The practical program examples are written in parallel in Assembly language, C, Pascal, and BASIC. The subjects covered are: writing for video cards; accessing hard & floppy drives; using expanded & extended memory; using BIOS & interrupts for I/O operations; writing device drives; programming for networks; writing TSR programs; using protected mode, DOS extensions and DPMI/VCPI; interfacing with DOS 6 and DoubleSpace, Intel's 486 CPUs series and Pentium processor. This newest edition includes multimedia hardware and software, covers sound cards, CD-ROM technology, new serial interfaces, graphic programming, interrupt controllers, DMA controllers and more.

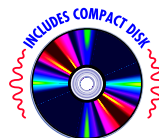

The companion CD-ROM contains vital information and programming code. In an easy to use hypertext system, the CD-ROM lets you find information even faster, making PC Intern a state of the art digital reference.

PC Underground Unconventional Programming Topics

PC Underground is not a criminal's handbook; instead it's an in depth programmer's guide to system level programming. It covers a diverse range of unconventional programming topics related to: memory management techniques, direct parallel port programming, (Sound Blaster and Gravis Ultrasound cards), assembly language techniques, and more. It includes extensive coverage of graphics - programming the VGA card, creating 3-D representations and effects, working with the image formats and the high resolution modes. The companion CD-ROM contains numerous graphics and sound demos, actual program code described in the book, a game on which you can try a "trainer", a series of helpful tools and several shareware utilities.
